GitHub Repo: <https://github.com/gengchenmai/se-kge>

# Speaker Background

- **Education**

- 5th year PhD in Geographic Information Science/Geoinformatics, UC Santa Barbara
- BS. in GIS, Wuhan University, China

- **Work Experience**

- Summer 2020: AI Resident at **Google X, the Moonshot Factory**, Mountainview, CA
- Summer 2019: Cartographic Engineer at **Apple Map**, Sunnyvale, CA
- Summer 2018: ML & NLP Research Intern at **Saymosaic Inc**, Palo Alto, CA
- Summer 2017: ML & Software Development Intern, **Esri Inc**, Redlands, CA

- **Past Achievements**

- 32 peer-review papers including 10 1st author papers
- Best Paper Award at AGILE 2019, Best Paper Award at ACM KCAP 2019 (co-author);  
Spotlight paper at ICLR 2020; Top 10% Most Downloaded Paper at TGIS

- **Research Interests**

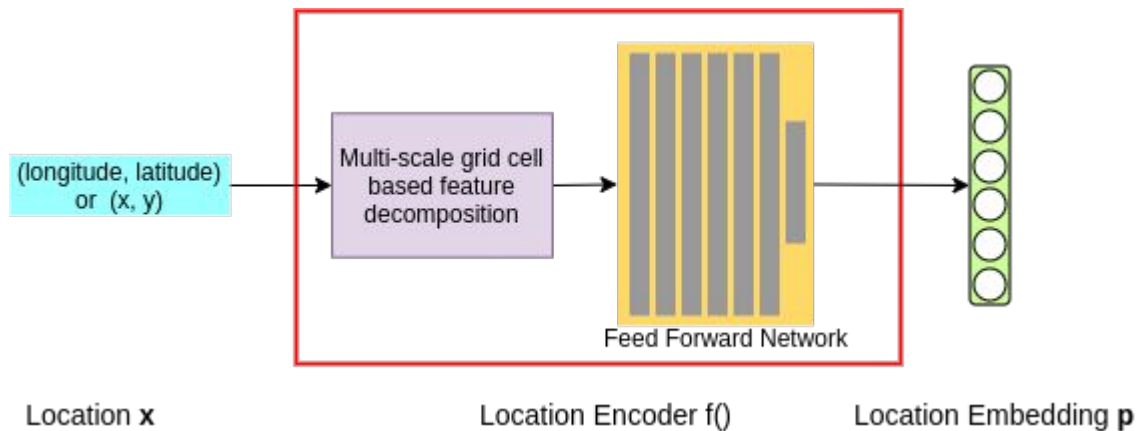

- Spatially Explicit Machine Learning; Geographic Knowledge Graph; GeoAI

# Outline

- **Space2Vec** (ICLR 2020 spotlight)
  - A representation learning model called Space2Vec to encode the absolute positions and spatial relationships of places inspired by biological grid cells.
  - **Tasks:** POI Classification; Geo-Aware Fine-Grained Image Classification
- **SE-KGE** (Transactions in GIS)
  - A location-aware knowledge graph embedding model based on Space2Vec
  - **Tasks:** geographic logic query answering; spatial semantic lifting

Embedding clustering of different location encoding models:  
(a)-(d) baselines (e)-(f) **Space2Vec**

# Unsupervised Text Encoding

Position Encoding: encode word positions with sinusoid functions of different frequencies

Transformer (Vaswani et al., 2017) BERT (Devlin et al., 2019)

# Problem Statement

## Distributed representation of point-features in space:

Given a set of points  $\mathcal{P} = \{p_i\}$ , i.e., Point Of Interests (POIs), in L-D space ( $L = 2,3$ ), each point  $p_i = (\mathbf{x}_i, \mathbf{v}_i)$  is associated with a location  $\mathbf{x}_i$  and attributes  $\mathbf{v}_i$  (i.e., POI feature such as type, name). We define function

$$f_{\mathcal{P},\theta}(\mathbf{x}) : \mathbb{R}^L \rightarrow \mathbb{R}^d \quad (L \ll d)$$

which maps any coordinate  $\mathbf{x}$  in space to a vector representation of  $d$  dimension

# Unsupervised Location Encoding

## 1. Radial Basis Function (RBF)

$$K(\mathbf{x}, \mathbf{x}') = \exp\left(-\frac{\|\mathbf{x} - \mathbf{x}'\|^2}{2\sigma^2}\right)$$

- choosing the correct scale is challenging
- Need to memorize the training samples

## 2. Tile-based approaches (Berg et al. 2014):

discretize the study area into regular grids

- choosing the correct scale is challenging
- does not scale well in terms of memory

## 3. Directly feed the coordinates into a FFN (inductive single-scale location encoder)

- hard to capture fine grained distributions

Geo-aware Image Classification (Mac Aodha et al., 2019)

# Key challenge for location encoding

- Joint modeling distributions with very different characteristics
- => **multi-scale location representations**

Women's Clothing  
(Clustered Distribution)

Education  
(Even Distribution)

# Grid Cell Based Multi-Scale Location Encoding

(a)

(b)

(c)

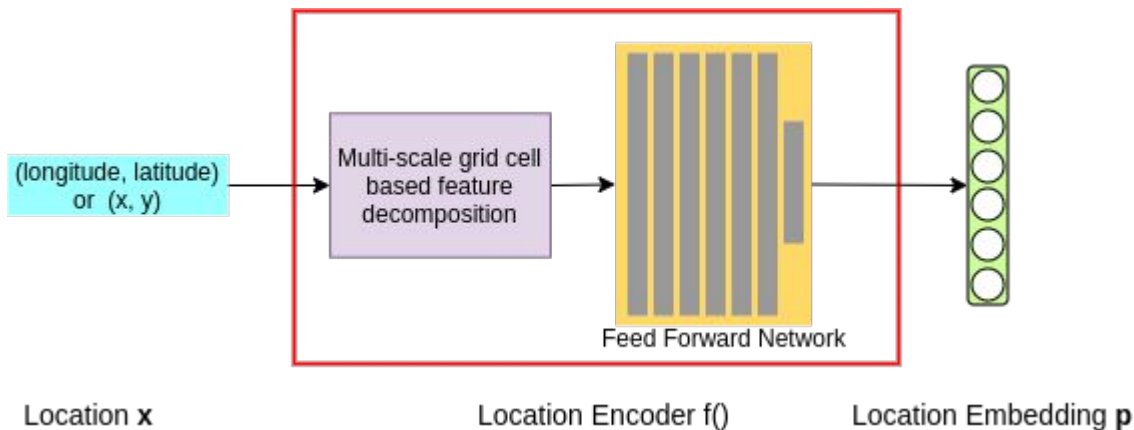

(d)

- **Grid cells** in mammals provide a **multi-scale periodic representation** that functions as a metric for location encoding.
- It can be simulated by summing **three cosine grating functions** oriented 60 degree apart (a **simple Fourier model of the hexagonal lattice**).

Mean grid spacing for all modules (M1–M4) in all animals (colour-coded)

# Point Space Encoder: Space2Vec

**Given a location  $\mathbf{x}$ :**

$$e[\mathbf{x}] = Enc_{theory}^{(x)}(\mathbf{x}) = \mathbf{NN}(PE^{(t)}(\mathbf{x}))$$

$$PE^{(t)}(\mathbf{x}) = [PE_0^{(t)}(\mathbf{x}); \dots; PE_s^{(t)}(\mathbf{x}); \dots; PE_{S-1}^{(t)}(\mathbf{x})]$$

$$PE_s^{(t)}(\mathbf{x}) = [PE_{s,1}^{(t)}(\mathbf{x}); PE_{s,2}^{(t)}(\mathbf{x}); PE_{s,3}^{(t)}(\mathbf{x})]$$

$$PE_{s,j}^{(t)}(\mathbf{x}) = [\cos(\frac{\langle \mathbf{x}, \mathbf{a}_j \rangle}{\lambda_{min} \cdot g^{s/(S-1)}}); \sin(\frac{\langle \mathbf{x}, \mathbf{a}_j \rangle}{\lambda_{min} \cdot g^{s/(S-1)}})] \forall j = 1, 2, 3;$$

# Point Feature Encoder

Point feature encoder  $Enc^{(v)}()$  encodes such features  $\mathbf{v}_i$  into a feature embedding  $\mathbf{e}[\mathbf{v}_i] \in \mathbb{R}^{d^{(v)}}$

$\mathbf{e}[\mathbf{v}_i]$

For example, if each point represents a POI with multiple POI types, the feature embedding can simply be the mean of each POI types' embeddings:

$$\mathbf{e}[\mathbf{v}_i] = \frac{1}{H} \sum_{h=1}^H \mathbf{t}_h^{(\gamma)}$$

$\mathbf{t}_h^{(\gamma)}$  indicates the hth POI type embedding of a POI  $p_i$  with H POI types

# POI classification - Location Modeling

**Location Decoder**  $Dec_s()$  : Directly reconstructs point feature embedding  $e[\mathbf{v}_i]$  given its space embedding  $e[\mathbf{x}_i]$

$$e[\mathbf{v}_i]' = Dec_s(\mathbf{x}_i; \theta_{dec_s}) = \mathbf{NN}_{dec}(e[\mathbf{x}_i])$$

For training we use inner product to compare the reconstructed feature embedding  $e[\mathbf{v}_i]'$  against the real feature embeddings  $e[\mathbf{v}_i]$  and other negative points

# POI classification - Spatial Context Modeling

**Spatial Context Decoder**  $Dec_c()$ : reconstructs the feature embedding  $e[\mathbf{v}_i]$  of the center point  $p_i$  based on the space and feature embeddings  $\{e_{i1}, \dots, e_{ij}, \dots, e_{in}\}$  of  $n$  nearby points  $\{p_{i1}, \dots, p_{ij}, \dots, p_{in}\}$

**Space-Aware Graph Attention Network Model:**

$$e[\mathbf{v}_i]' = Dec_c(\mathbf{x}_i, \{e_{i1}, \dots, e_{ij}, \dots, e_{in}\}; \theta_{dec_c}) = g\left(\frac{1}{K} \sum_{k=1}^K \sum_{j=1}^n \alpha_{ijk} e[\mathbf{v}_{ij}]\right)$$

$$\alpha_{ijk} = \frac{\exp(\sigma_{ijk})}{\sum_{o=1}^n \exp(\sigma_{io k})}$$

$$\sigma_{ijk} = LeakyReLU(\mathbf{a}_k^T [e[\mathbf{v}_i]_{init}; e[\mathbf{v}_{ij}]; e[\mathbf{x}_i - \mathbf{x}_{ij}]])$$

# Unsupervised Training

The unsupervised learning task can simply be maximizing the log likelihood of observing the true point  $p_i$  at position  $\mathbf{x}_i$  among all the points in  $\mathcal{P}$

$$\mathcal{L}_{\mathcal{P}}(\theta) = - \sum_{p_i \in \mathcal{P}} \log P(p_i | p_{i1}, \dots, p_{ij}, \dots, p_{in}) = - \sum_{p_i \in \mathcal{P}} \log \frac{\exp(\mathbf{e}[\mathbf{v}_i]^T \mathbf{e}[\mathbf{v}_i]')}{\sum_{p_o \in \mathcal{P}} \exp(\mathbf{e}[\mathbf{v}_o]^T \mathbf{e}[\mathbf{v}_i]')}$$

Negative Sampling:

$$\mathcal{L}'_{\mathcal{P}}(\theta) = - \sum_{p_i \in \mathcal{P}} \left( \log \sigma(\mathbf{e}[\mathbf{v}_i]^T \mathbf{e}[\mathbf{v}_i]') + \frac{1}{|\mathcal{N}_i|} \sum_{p_o \in \mathcal{N}_i} \log \sigma(-\mathbf{e}[\mathbf{v}_o]^T \mathbf{e}[\mathbf{v}_i]') \right)$$

# Conclusion for Space2Vec:

- We introduced an encoder-decoder framework as a general-purpose representation model for space inspired by **biological grid cells' multi-scale periodic representations**.
- We show the effectiveness of Space2Vec on two tasks: **POI classification** and **geo-aware image classification**.
- Our analysis reveals that it is the **ability to integrate representations of different scales** that makes the grid cell models outperform other baselines on these two tasks

# SE-KGE: A Location-Aware Knowledge Graph Embedding Model for Geographic Question Answering and Spatial Semantic Lifting

Spatial semantic lifting in the SE-KGE embedding space

# SE-KGE: A Location-Aware KG Embedding Model

A novel KGE model which **directly encodes spatial footprints**, namely **point coordinates** and **bounding boxes**, thereby making them available while learning knowledge graph embeddings.

Encoding spatial footprints of geographic entities:

- **Location encoder** (Mai et al., 2020): the neural network models which encode a pair of coordinates into a high dimensional embedding which can be used in multi downstream tasks

# Challenges of SE-KGE

1. Location encoding can handle **point-wise metric relations** (e.g., `dbo:nearestCity`) and **directional relations** (e.g., `dbp:north`) in KGs, but it is not easy to encode containment relations (e.g., `dbo:isPartOf`).
  - Represent geographic entities as **regions** instead of points in the embedding space
2. How to seamlessly handle **geographic** and **non-geographic entities**?
3. How to capture the **spatial** and **other semantic aspects** at the same time?
4. **Spatial Semantic Lifting**: How to design a KGE model so that it can be used to infer new relations between entities in a KG and any arbitrary location in the study area?

# Method: GeoKG Definition

Given a geographic knowledge graph  $\mathcal{G} = (\mathcal{V}, \mathcal{E})$

- $V$  : the set of entities/nodes
- $E$  : the set of directed edges
- $\mathcal{V}_{pt} \subseteq \mathcal{V}$ : the geographic entity set
- $\mathcal{PT}(\cdot)$ : entity  $e \in \mathcal{V}_{pt} \Rightarrow \mathcal{PT}(e) = \mathbf{x}$  where  $\mathbf{x} \in \mathcal{A} \subseteq \mathbb{R}^2$
- $\mathcal{V}_{pn} \subseteq \mathcal{V}_{pt}$ : the set of large-scale geographic entity
- $\mathcal{PN}(\cdot)$ : entity  $e \in \mathcal{V}_{pn} \Rightarrow \mathcal{PN}(e) = [\mathbf{x}^{min}; \mathbf{x}^{max}] \in \mathbb{R}^4$  where  $\mathbf{x}^{min}, \mathbf{x}^{max} \in \mathcal{A} \subseteq \mathbb{R}^2$

# Method: CQG Definition

**Definition 2** (Conjunctive Graph Query (CGQ)). *A query  $q \in Q(\mathcal{G})$  that can be written as follows:*

$$q = V_?. \exists V_1, V_2, \dots, V_m : b_1 \wedge b_2 \wedge \dots \wedge b_n$$

$$\text{where } b_i = r_i(e_k, V_l), V_l \in \{V_?, V_1, V_2, \dots, V_m\}, e_k \in \mathcal{V}, r \in \mathcal{R}$$

$$\text{or } b_i = r_i(V_k, V_l), V_k, V_l \in \{V_?, V_1, V_2, \dots, V_m\}, k \neq l, r \in \mathcal{R}$$

- $Q(\mathcal{G})$  : a set of all conjunctive graph queries that can be asked over  $G$
- $V_?$  : the target variable of query  $q$  (target node)
- $V_1, V_2, \dots, V_m$ : existentially quantified bound variables (bound nodes)
- $b_i$  : a basic graph pattern in this CGQ
- $e_k$ : the entity node appeared in the question (anchor node)

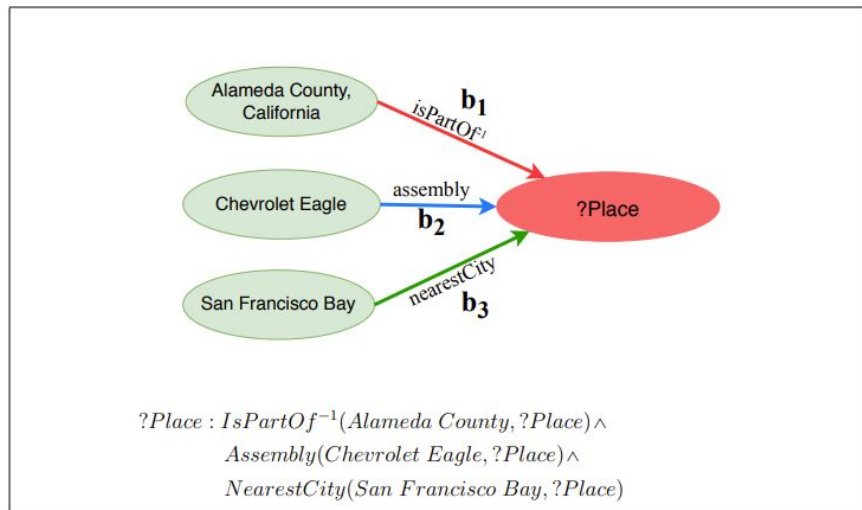

The dependency graph of Query  $q$  is a **directed acyclic graph** (DAG)

**Geographic CGQ:** the answer entity is a geographic entity

# Method: CQG Example

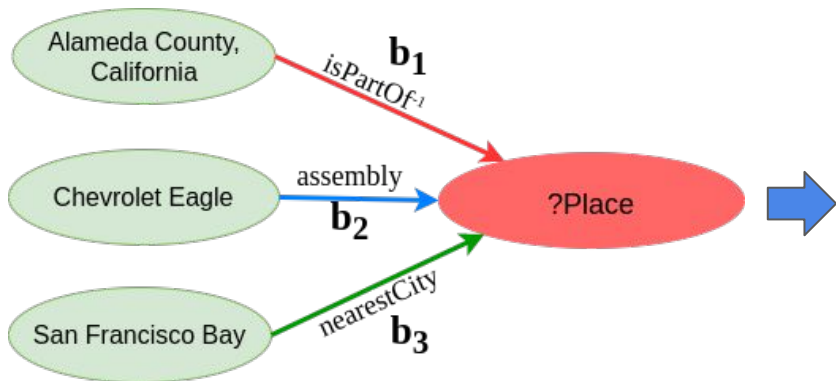

Which city in Alameda County, California is the assembly place of Chevrolet Eagle and the nearest city to San Francisco Bay?

# Method: Three Components for GeoQA

There major components of SE-KGE:

- **Entity encoder**  $Enc()$
- **Projection operator**  $\mathcal{P}()$
- **Intersection operator**  $\mathcal{I}()$

Input Entity Embedding

Output Query Embedding

# Method: Space Semantic Lifting

Use entity encoder  $Enc()$  and projection operator  $\mathcal{P}()$  for spatial semantic lifting:

Note that location encoder is one component of entity encoder

# Method: Location-Aware Entity Encoder

- Semantic Aspect:

**Definition 4** (Entity Feature Encoder:  $Enc^{(c)}()$ ). Given any entity  $e_i \in \mathcal{V}$  with type  $c_i = \Gamma(e_i) \in \mathcal{C}$  from  $\mathcal{G}$ , entity feature encoder  $Enc^{(c)}()$  computes the feature embedding  $\mathbf{e}_i^{(c)} \in \mathbb{R}^{d^{(c)}}$  which captures the type information of entity  $e_i$  by using an embedding lookup approach:

$$\mathbf{e}_i^{(c)} = Enc^{(c)}(e_i) = \frac{\mathbf{Z}_{c_i} \mathbf{h}_i^{(c)}}{\|\mathbf{Z}_{c_i} \mathbf{h}_i^{(c)}\|_{L2}} \quad (5)$$

- Space Aspect:

**Definition 7** (Entity Space Encoder:  $Enc^{(x)}()$ ). Given any entity  $e_i \in \mathcal{V}$  from  $\mathcal{G}$ ,  $Enc^{(x)}()$  computes the space embedding  $\mathbf{e}_i^{(x)} = Enc^{(x)}(e_i) \in \mathbb{R}^{d^{(x)}}$  by

$$\mathbf{e}_i^{(x)} = \begin{cases} LocEnc^{(x)}(\mathbf{x}_i), \text{ where } \mathbf{x}_i = \mathcal{PT}(e_i), & \text{if } e_i \in \mathcal{V}_{pt} \setminus \mathcal{V}_{pn} \\ LocEnc^{(x)}(\mathbf{x}_i^{(t)}), \text{ where } \mathbf{x}_i^{(t)} \sim \mathcal{U}(\mathbf{x}_i^{min}, \mathbf{x}_i^{max}), \mathcal{PN}(e_i) = [\mathbf{x}_i^{min}; \mathbf{x}_i^{max}], & \text{if } e_i \in \mathcal{V}_{pn} \\ \frac{\mathbf{Z}_x \mathbf{h}_i^{(x)}}{\|\mathbf{Z}_x \mathbf{h}_i^{(x)}\|_{L2}}, & \text{if } e_i \in \mathcal{V} \setminus \mathcal{V}_{pt} \end{cases}$$

# Method: Location-Aware Entity Encoder

- Entity Feature Encoder
- Entity Space Encoder

Encoding results are concatenated as the final output

# Method: Location-Aware Projection Operator

**Definition 8** (Projection Operator  $\mathcal{P}()$ ). Given a geographic knowledge graph  $\mathcal{G}$ , a projection operator  $\mathcal{P}() : \mathcal{V} \cup \mathcal{A} \times \mathcal{R} \rightarrow \mathbb{R}^d$  maps a pair of  $(e_i, r)$ ,  $(V_i, r)$ , or  $(\mathbf{x}_i, r)$ , to an embedding  $\mathbf{e}'_i$ . According to the input,  $\mathcal{P}()$  can be treated as: (1) **link prediction**  $\mathcal{P}^{(e)}(e_i, r)$ : given a triple's head entity  $e_i$  and relation  $r$ , predicting the tail; (2) **link prediction**  $\mathcal{P}^{(e)}(V_i, r)$ : given a basic graph pattern  $b = r(V_i, V_j)$  and  $\mathbf{v}_i$  which is the computed embedding for the existentially quantified bound variable  $V_i$ , predicting the embedding for Variable  $V_j$ ; (2) **spatial semantic lifting**  $\mathcal{P}^{(x)}(\mathbf{x}_i, r)$ : given an arbitrary location  $\mathbf{x}_i$  and relation  $r$ , predicting the most probable linked entity. Formally,  $\mathcal{P}()$  is defined as:

$$\mathbf{e}'_i = \begin{cases} \mathcal{P}^{(e)}(e_i, r) = \text{diag}(\mathbf{R}_r^{(c)}, \mathbf{R}_r^{(x)}) \text{Enc}(e_i) = \text{diag}(\mathbf{R}_r^{(c)}, \mathbf{R}_r^{(x)}) \mathbf{e}_i & \text{if input} = (e_i, r) \\ \mathcal{P}^{(e)}(V_i, r) = \text{diag}(\mathbf{R}_r^{(c)}, \mathbf{R}_r^{(x)}) \mathbf{v}_i & \text{if input} = (V_i, r) \\ \mathcal{P}^{(x)}(\mathbf{x}_i, r) = \text{diag}(\mathbf{R}_r^{(xc)}, \mathbf{R}_r^{(x)}) [\text{LocEnc}^{(x)}(\mathbf{x}_i); \text{LocEnc}^{(x)}(\mathbf{x}_i)] & \text{if input} = (\mathbf{x}_i, r) \end{cases}$$

	$hometown^{-1}(\mathbf{x}, ?e)$	61.44	<b>76.83</b>	15.39

# Conclusion for SE-KGE

- We develop a spatially-explicit knowledge graph embedding model, SE-KGE, which applies a location encoder to incorporate spatial information (coordinates and spatial extents) of geographic entities.
- SE-KGE is extended as end-to-end models for two tasks: geographic question answering and spatial semantic lifting (a new task).
- Evaluation results show that SE-KGE can outperform multiple baselines on two tasks.
- Visualization shows that SE-KGE can successfully capture the spatial proximity information as well as the semantics of relations.

## Future work:

- We want to explore a more concise way to encode the spatial footprints of geographic entities in a KG
